The present invention relates to novel human coding sequences (ABQ99268-ABQ99608) and proteins (ABP64682-ABP65022). The sequences are useful in therapeutic, diagnostic and research methods. The polynucleotides may be used in the field of molecular biology as hybridisation probes, primers for PCR, for chromosome and gene mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The commercial of an in diagnostics as expressed sequence tags of protein, or in generation of anti-sense DNA or RNA. The coloured some in the proteins may be used as molecular weight markers, or as nutritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or pluripotential state and expand cell population in a totipotential or pluripotential state and expand cell population in a totipotential or pluripotential state and expand cell population in a totipotential or pluripotential state and expand sources or supplements or the development of bio-sensors. The polynucleotides and proteins are useful for preventing, treating or manufacture of bio-pharmaceuticals or the development of bio-sensors. The polynucleotides and proteins are useful for preventing, treating or meniorating disorders involving aberrant protein expression or biological activity, e.g. haematopoietic disorders, central/peripheral nervous system diseases mechanical and traumatic disorders, non-healing virial, bacterial or fungal infection, autoimmune disorders, allergic reactions and conditions, coagulation disorders, or cancer. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polynucleotide sequences of the invention were assembled from ESTs isolated mainly by sequencing by hybridisation, and in some cases, sequences obtained from one or more public databases. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
New isolated polynucleotide, useful in research, diagnostic or therapeutic methods, e.g. preventing or treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                   Claim 20; SEQ ID NO 502; 394pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 273 AA;

                                                                                                                                                                                                                                                                                                                                                                                         The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in they wind int/published la-OCT-2001) which is available in they wind int/published patent word (Updated on 29-AUG-2003) to

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of F. luminescens and related species; to study polymorphisms; for gene analysis and for and related species; to study polymorphisms; for gene analysis and for detection/demilication of the genes are used for detection/ldemilication of the genes are used for detection/ldemilication of polypeptides encoded by the genes are used for detection/ldemilication of P. luminescens, e.g. in foods "The genes, proteins, ba and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or mirroorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The crombinant production of the proteins, particularly toxins or fungi that the sensitive to P. luminescens containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens and the proteins are as virulence are presentiales one of the genes and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for choromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yegurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at the patent with pub/published_pct_sequences. The invention relates to Reeudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as templates for antibacterial drugs, including anti-P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

The invention relates to isolated polymucleotide (I) and polypeptide (II)

sequences. (I) is useful as hybridisation probes, polymerase chain
reaction (PCR) primers, oilgomers, and for chromosome and gene mapping,
and in recombinant production of (II). The polymucleotides are also used
and in recombinant production of (III). The polymucleotides are also used
consists in useful in gene therapy techniques to restore normal
consists in useful in gene therapy techniques to restore normal
consists in tissue, as molecular weight markers and as a food
supplement. (II) and its binding partners are useful in medical imaging
of sites expressing (II). (I) and oils binding partners are useful in medical imaging
consists in tissue, as molecular weight markers and as a food
supplement. (II) and its binding partners are useful in medical imaging
of sites expressing (II). (I) and (II) are useful for treating disorders
colypeptide and polymucleotide sequences have applications in
dispospice, forensics, gene mapping, identification of mutations
colypeptide for genetic disorders or other traits to assess biodiversity
and to produce other types of data and products dependent on DNA and
and to produce other types of data man products dependent on DNA and
and to produce other types of the invention. Note: The sequence data for this
patent did not appear in the printed specification, but was obtained in

condition or susceptibility to a neoplastic condition based on the amount of expression of the eIF3 protein. The methods, compounds and kits are useful in therapeutics, diagnostic and screening methods for human cancer and related malignancies, e.g. ovarian, breast, lung, colon, prostate, pancreatic or gastrointestinal cancer, or melanoma. Sequences ABR82213-16 represent compounds derived from the human antigen eIF3
                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
           The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and immunomodulatory. The compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of antibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for calls characterised by expression of antigen EIF3 (melanoma antigen cells characterised by expression of antigen such as immunogens for a detectable agent may be used in diagnostic procedures, such as in the production and purification of antibodies, and as immunogens for production of antibodies. The polynucleotides can be used as primers for detecting genes or gene transcribts expressed in APC to confirm transduction of the polynucleotides into host cells. The current sequence transduction of the polynucleotides into host cells. The current sequence are processed and the polynucleotides into host cells. The current sequence are such as primers and the polynucleotides into host cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

```

The invention relates to aiding in the diagnosis of a neoplastic condition or susceptibility to a neoplastic condition of an animal cell or tissue. The method involves determining the amount of expression of an eukaryotic translation initiation factor 3 (eff3) protein in a test sample isolated from the cell or tissue, and diagnosing a neoplastic

Claim 12; Page 30; 77pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                         The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparies. The activity of the compounds of the invention may be described as cytostatic and immunomodulatory. The compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cells characterised by expression of antigen EIF3 (melanoma antigen eukaryotic initiation factor). The peptides or polypeptides conjugated to a detectable agent may be used in diagnostic procedures, such as in the
                                                                                                                                                                                                                                                                                                            detection and purification of antibodies, and as immunogens for production of antibodies. The polynucleotides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm transduction of the polynucleotides into host cells. The current sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            dermatological; immunosuppressive; antiinflammatory; anti-HIV; immunostimulant; cytostatic; cardiant; vascular; anti-angiogenic; ophthalmological; neuroprotectant; noorropic; anticonvulsant; vaccine; antialzheimer; antiparkinsonian; antimicrobial; vulnerary; gene therapy; immune disorder; hyperproliferative disorder; cardiovascular disease; cancer; angiogenic disorder; neurological disorder; infectious disease; wound healing; regeneration; chemotaxis.
                                                                                                                                                                                                                                                                                                                                                                              represents the human cancer antigen eIF3 variant 4 amino acid sequence. Note: This sequence is not present in the specification, but may be created from the sequence of the wild-type human cancer antigen eIF3
               New therapeutic compounds useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules.

AAP81787 to AAF81817 encode the human secreted proteins given in AAB74733 to AAB74772. Human secreted proteins can have activities based on the tissues and cells they are expressed in. Example of activities include: immunomodulatory; antisclerotic; dermatological; immunosuppressive; antiinflammatory; anti-HIV; immunostimulant; cytostatic; cardiant; cyscular; anti-angiogenic; ophthalmological; neuroprotectant; noctropic; anticonvulsant; anti-angiogenic; ophthalmological; neuroprotectant; noctropic; anticonvulsant; antialzheimers; antiparkinsonian; antimicrobial; and vulnerary. Human secreted protein nucleotide sequences (NAMI) and proteins (PEPI) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypebtide expression. For example, NAMI and PEPI may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patients genome that affect the activity of proteins by expressing inactive proteins or to supplement the patients own production of polypeptides. Disorders that may be prevented, diagnosed and/or treated include immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        may be prevented, diagnosed and/or treated include immune disorders, hyperproliferative disorders (e.g. cancers), cardiovascular diseases, angiogenic disorders, neurological disorders, infectious diseases and/or for promoting wound healing, regeneration and /or chemotaxis. AAF81778 to AAF81786 and AAB74732 represent sequences used in the exemplification of
Nucleic acids encoding 25 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Albumin fusion protein; therapeutic protein X; human albumin; HA, human serum albumin; HSA; cancer; reproductive disorder; digestive disorder; immune disorder; endocrine disorder; haematopoietic disorder; neural disorder; connective disorder; cytostatic; antilinfertility; antiliflammatory; antilucer; immunomodulator; anti-HIV; antidiabetic; heemostatic; nootropic; neuroprotective; antiparkinsonian; antimicrobial; neuroleptic;

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin, HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivorinty. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders (e.g. acquired disorders, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention
                                                                                                                                                      New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein.
                                                                                                                                                                                                                      Claim 1; Page 1908; 2102pp; English.

```
The invention relates to a novel albumin fusion protein. The invention colling further relates to: a composition comprising the albumin fusion protein and a pharmaceutical carrier; a kit comprising the albumin fusion protein of the albumin fusion protein formula; a method of treating a disease or disease or disorder in a patient comprising the step of administering the albumin fusion protein; as method of treating a patient comprising the step of administering the albumin fusion protein; an entertainty annelsic acid molecule comprising a polymulation to make it a method of extending the shelf life of Therapeutic protein; and a host cell comprising the nucleic acid molecule of the albumin fusion protein; and a host cell comprising the nucleic acid molecule of the albumin fusion protein; and a host cell comprising the nucleic acid molecule of the albumin fusion protein; and a host cell comprising the nucleic antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antiansemic, antianse
                      New albumin fusion proteins, useful for diagnosing, treating, preventing
                                      or ameliorating diseases or disorders e.g. cancer, anemia, arthritis, asthma, inflammatory bowel disease or Alzheimer's disease.
                                                                                                     Disclosure; SEQ ID NO 2059; 279pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human secreted proteins, and encode the proteins given in AAY12897 to human secreted proteins, and encode the proteins given in AAY12897 to AAY13199, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, these growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haematory trimbolytic activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity on other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell or activity and cell or activity and cell or activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity a

5. ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTS sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA primed cDNA libraries such ESTS are not well suited for isolating cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
The present sequence is a polypeptide encoded by one of a large number of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Secreted protein, kidney, lung, brain, blood, testis, bone marrow, nutritional activity, cytokine, cell proliferation; immune stimulation, hematopoiesis regulation; tissue growth; thrombolytic, gene therapy; anti-inflammatory; tumour invasion.

The invention relates to secreted proteins (AAY17219-228) encoded by colynucleotides obtained from human fetal kidney, adult lung, adult brain, adult blood, adult testes, and fetal brain and murine adult bone marrow cDNA libraries. The secreted protein nucleic acid sequences (K6801-811) correspond to clones bd306-7, gj283-6, fK317-3, K213-2x, na316-1, nf93-20 np164-1, pe204-1, yal-1 and yb-1, (all clones are deposited as ATCC 98599); The PNS and proteins are predicted to have cological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, contritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, inhibit activity, teceptor/ligand activity, haemostatic and chromobolykic activity, receptor/ligand activity, haemostatic and chromobolykic activity, receptor/ligand activity, anti-inflammatory activity, receptor/ligand activity, anti-inflammatory activity, receptor/ligand activity, anti-inflammatory activity, receptor/ligand activity, anti-inflammatory activity, receptor/ligand activity, activity, receptor/ligand activity, anti-inflammatory activity, receptor/ligand activity, activity, activity, receptor/ligand activity, activity, activity, receptor/ligand activity, activity, activity, receptor/ligand activity, activity, activity, receptor/ligand activity, activity, activity, receptor/ligand activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, receptor/ligand activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity, activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; secreted protein; antiinflammatory; immunosuppressive; nootropic; neuroprotective; antiarthritic; antimicrobial; vulnerary; cytostatic; antidabetic; virucide; antiinfertility; anticonvulsant; vasotropic; antiparkinsonian; immunostimulan; dermatological; antirheumatic; antitumor; antiulcer; osteopathic; tranquiliser; cerebroprotective; oyrokine; call proliferation; call differentiation; immune deficiency; severe combined immunodeficiency; SCID; tumour; autoimmune disorder; multiple sclerosis; rheumatoid arthritis graft-versus-host disease; mysloid deficiency; wound healing; ulcer; periodontal disease; esteoprosis, osteoparchritis, Alzheimer's disease; stroke; sepsis; Huntington's disease; infection; cardiac disease; stroke; sepsis; infilammatory bowel disease; contraceptive; immunogen; food supplement;

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiencies and disorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus curvenances are also unseful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versue-host diseases (GVHD), in the induction of tumour immunity, myeloid or lymphoid cell deficiencies, wound healths and treatment of periodontal cours, incisions and ulcers, as well as in treatment of periodontal course, incisions and ulcers, as well as in treatment of periodontal courses of the peripheral nervous system vessel e.g. stroke, sepsis, inflammatory barbone central nervous system vessel e.g. stroke, sepsis, inflammatory contraral nervous system vessel e.g. stroke, sepsis, inflammatory barbone contraral nervous system vessel e.g. stroke, sepsis, inflammatory but indicate activities is useful as a contraceptive based on the collibibin-related activities is useful as a contraceptive based on the cability of inhibins male mammals. The proteins and nucleic acids are also contrain a food supplements. The proteins and nucleic acids are also contrained to the invantion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to isolated polynucleotides (ABA90876-ABA90968 and ABA90800) and encoded proteins (ABB55698-ABB55800), especially polynucleotides SEQ ID NO 1 (ABA90876) and SEQ ID NO 19 (ABA90885) and proteins SEQ ID NO 2 (ABB55698) and SEQ ID NO 20 (ABB55707) contained in accession number 98599. The polynucleotides and encoded polypeptides have cression number 98599. The polynucleotides and encoded polypeptides have cytostatic, anti-inflammatory, immunomodulator, vulnerary, neuroprotective, activin, inhibin, chemotactic, hacemostatic, thrombolytic and anti-inflammatory activity and acting as cytokine modulators, nationating and acting as cytokine modulators. Compressence: The polypeptides and polynucleotides are useful in gene therapies, particularly for preventing, treating or ameliorating any of the following diseases: immune deficiency and disorders; e.g. bacterial or fungal infections, autoimmune disorders, cancer, systemic lupus or fungal infections, autoimmune disorders, cancer, systemic lupus erythematosus or graft-versus-host disease; myeloid or lymphoid cell deficiencies; wound, burns, incisions and ulcers, osteoporosis or cettoratitis; central and peripheral nervous system diseases and
Alzheimer's disease; Parkinson's disease; Huntington's disease; activin; haemophilia; cardiac infarction; stroke; sepsis; arthritis; vulnerary; ischaemia-reperfusion injury; inflammatory bowel disease; chemotactic; Crohn's disease; cytostatic; anti-inflammatory; immunomodulator; neuroprotective; haemostatic; thrombolytic; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New secreted proteins and encoding polynucleotides, useful in gene therapies, particularly for preventing or treating autoimmune disorders, cancer, graft-versus-host disease, wound, osteoporosis, stroke or

The proteins of the invention have cytostatic, thrombotic and osteopathic activity. The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and secretion vectors

AAZ56698 to AAZ56776 encode AAY57877 to AAY57955 which represent human transmembrane protein designated HTMPN-1 to HTMPN-79, respectively. The transmembrane protein have immunospecific, antiproliferative and neuroprotective activities. The human transmembrane proteins and polynucleotides encoding them and other compositions and methods from the present invention, can be used for the disgnosis, treatment or prevention of immune, reproductive, smooth muscle, neurological, gastrointestinal, to treat or prevent disorders associated with a decreased expression or activity of HTMPN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antianaemic; vulnerary; antiulcer; osteopathic; anti-inflammatory; cytostatic; gene therapy; autoimmune disorder; multiple sclerosis; HIV infection; anaemia; burn; ulcer; osteoporosis; tumour; wound healing; inflammatory bowel disease; nutritional supplement; appetite; vaccine; behavioural characteristic; immune response.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY36129-Y36222 represent novel human secreted proteins encoded by the extended cDNA sequences represented in AAX97813-X97906. The proteins of the invention have cytostatic, thrombotic and osteopathic activity. The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and

AAP84417 to AAF84516 encode the human proteins given in AAB88557 to
AAB88606 (I) which have a hydrophobic domain. (I) have immunosuppressant,
CC AAB88606 (I) which have a hydrophobic domain. (I) have immunosuppressant,
CC CAAB88606 (I) which have a hydrophobic domain. (I) have immunosuppressant,
CC cateopathic, anti-inflammatory and cytostatic activities, and can be used
CC in gene therapy. (I) can be used as pharmaceuticals and as antigens to
CC prepare antibodies. DNA and cDNA (II) encoding (I) can be used as probes
CC of ligands or receptors corresponding to membrane or secretory proteins
CC of ligands or receptors corresponding to membrane or secretory proteins
CC of ligands or receptors corresponding to membrane or secretory proteins
CC of ligands or receptors corresponding to membrane or secretory proteins
CC of ligands or receptors corresponding to membrane or secretory proteins
CC of ligands or receptors corresponding to membrane or secretory proteins
CC of ligands or receptors corresponding to membrane or secretory proteins
CC (I). Activities of (I) may include cytokine and cell
CC (I). Activities of (I) may include cytokine and cell
CC (I). Activities of (I) may include cytokine and cell
CC (I). Activities of (I) may include cytokine and cell
CC (I). Activity, haematopolesis regulating activity, tissue growth activity,
CC activity, haematopolesis regulating activity, tissue growth activity,
CC and thrombolytic activity, receptor/ligand activity, haematory activity, receptor/ligand activity, haematory bowel disease and tumours. (I) and (II) can also be used for wound healing, as nutritional sources or supplements e.g. as amino activity as nutritional sources or supplements e.g. as amino activity and utilisatests and tumours. (I) and (II) can also be used for vound healing, as nutritional sources or supplements e.g. as amino activity and can act as antigens in vaccines to raise an immune response to the protein or another material cross-reactive with the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human proteins with hydrophobic domains and the DNAs which encode them are useful for treating autoimmune disorders, burns and tumors and for screening novel pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Page 478-479; 518pp; English.
